

LM146/LM346

Programmable Quad Operational Amplifiers

General Description

The LM146 series of quad op amps consists of four independent, high gain, internally compensated, low power, programmable amplifiers. Two external resistors (R_{SET}) allow the user to program the gain bandwidth product, slew rate, supply current, input bias current, input offset current and input noise. For example, the user can trade-off supply current for bandwidth or optimize noise figure for a given source resistance. In a similar way, other amplifier characteristics can be tailored to the application. Except for the two programming pins at the end of the package, the LM146 pin-out is the same as the LM124 and LM148.

Features

- ($I_{SET}=10\text{ }\mu\text{A}$)
- Programmable electrical characteristics
- Battery-powered operation
- Low supply current: 350 μA /amplifier
- Guaranteed gain bandwidth product: 0.8 MHz min
- Large DC voltage gain: 120 dB
- Low noise voltage: 28 $\text{nV}/\sqrt{\text{Hz}}$
- Wide power supply range: $\pm 1.5\text{V}$ to $\pm 22\text{V}$
- Class AB output stage—no crossover distortion
- Ideal pin out for Biquad active filters
- Input bias currents are temperature compensated

PROGRAMMING EQUATIONS

Total Supply Current = 1.4 mA ($I_{SET}/10\text{ }\mu\text{A}$)

Gain Bandwidth Product = 1 MHz ($I_{SET}/10\text{ }\mu\text{A}$)

Slew Rate = 0.4V/ μs ($I_{SET}/10\text{ }\mu\text{A}$)

Input Bias Current $\approx 50\text{ nA}$ ($I_{SET}/10\text{ }\mu\text{A}$)

I_{SET} = Current into pin 8, pin 9 (see schematic-diagram)

$$I_{SET} = \frac{V^+ - V^- - 0.6\text{V}}{R_{SET}}$$

Capacitorless Active Filters (Basic Circuit)

Absolute Maximum Ratings (Notes 1,

5)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

	LM146	LM346

CM Rejection Ratio	R _S ≤50Ω, T _A =25°C		80			80		dB
Output Voltage Swing	R _L ≥10 kΩ, T _A =25°C	±0.6			±0.6			V

Note 1: For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.**Note 2:** The maximum power dissipation for these devices must be derated at elevated temperatures and is dictated by T_{JMAX}, θ_{JA}, and the ambient temperature, T_A. The maximum available power dissipation at any temperature is P_d=(T_{JMAX} - T_A)/θ_{JA} or the 25°C P_{dMAX}, whichever is less.**Note 3:** Any of the amplifier outputs can be shorted to ground indefinitely; however, more than one should not be simultaneously shorted as the maximum junction temperature will be exceeded.**Note 4:** These specifications apply over the absolute maximum operating temperature range unless otherwise noted.**Note 5:** Refer to RETS146X for LM146J military specifications.

Transient Response Test Circuit

00565406

Application Hints

Avoid reversing the power supply polarity; the device will fail.

COMMON-MODE INPUT VOLTAGE

The negative common-mode voltage limit is one diode drop above the negative supply voltage. Exceeding this limit on either input will result in an output phase reversal. The positive common-mode limit is typically 1V below the positive supply voltage. No output phase reversal will occur if this limit is exceeded by either input.

OUTPUT VOLTAGE SWING VS I_{SET}

For a desired output voltage swing the value of the minimum load depends on the positive and negative output current capability of the op amp. The maximum available positive output current, (I_{CL+}), of the device increases with I_{SET} whereas the negative output current (I_{CL-}) is independent of I_{SET} . *Figure 1* illustrates the above.

INPUT CAPACITANCE

The input capacitance, C_{IN} , of the LM146 is approximately 2 pF at $T_J = 25^\circ\text{C}$ to 125°C .

Application Hints (Continued)

00565410

FIGURE 4. LM146 vs LM4250

Typical Applications

Dual Supply or Negative Supply Blasing

00565439

$$I_{SET} \approx \frac{|V^-| - 0.6V}{R_{SET}}$$

Single (Positive) Supply Blasing

00565411

$$I_{SET} \approx \frac{V^+ - 0.6V}{R_{SET}}$$

Current Source Blasing with Temperature Compensation

00565440

$$I_{SET} = \frac{67.7 \text{ mV}}{R_{SET}}$$

- The LM334 provides an I_{SET} directly proportional to absolute temperature. This cancels the slight GBW product Temperature coefficient of the LM346.

Typical Applications (Continued)

Blasing all 4 Amplifiers
with Single Current Source

00565441

$$\frac{I_{SET1}}{I_{SET2}} = \frac{R2}{R1}, I_{SET1} + I_{SET2} = \frac{67.7 \text{ mV}}{R_{SET}}$$

- For $I_{SET1} = I_{SET2}$ resistors R1 and R2 are not required if a slight error between the 2 set currents can be tolerated. If not, then use $R1 = R2$ to create a 100 mV drop across these resistors.

Active Filters Applications

Basic (Non-Inverting "State Variable") Active Filter Building Block

00565412

Active Filters Applications (Continued)

- The LM146 quad programmable op amp is especially suited for active filters because of their adequate GBW product and low power consumption.

Circuit synthesis equations (for circuit analysis equations, consult with the LM148 data sheet).

Need to know desired: f_o = center frequency measured at the BP output

Q_o = quality factor measured at the BP output

H_o = gain at the output of interest (BP or HP or LP or all of them)

- Relation between different gains: $H_o(BP) = 0.316 \times Q_o \times H_o(LP)$; $H_o(LP) = 10 \times H_o(HP)$

- $R \times C = \frac{5.033 \times 10^{-2}}{f_o}$ (sec)

- For BP output: $R_Q = \left(\frac{3.478 Q_o - H_o(BP)}{10^5} - \frac{H_o(BP)}{10^5 \times 3.748 \times Q_o} \right)^{-1}$; $R_{IN} = \frac{\left(\frac{3.478 Q_o - 1}{H_o(BP)} \right)}{\frac{1}{R_Q} + 10^{-5}}$

- For HP output: $R_Q = \frac{1.1 \times 10^5}{3.478 Q_o (1.1 - H_o(HP)) - H_o(HP)}$; $R_{IN} = \frac{\frac{1.1}{H_o(HP)} - 1}{\frac{1}{R_Q} + 10^{-5}}$

- For LP output: $R_Q = \frac{11 \times 10^5}{3.478 Q_o (11 - H_o(LP)) - H_o(LP)}$; $R_{IN} = \frac{\frac{11}{H_o(LP)} - 1}{\frac{1}{R_Q} + 10^{-5}}$

- For BR (notch) output: Use the 4th amplifier of the LM146 to sum the LP and HP outputs of the basic filter.

00565433

Note. All resistor values are given in ohms.

00565413

$$\sqrt{\frac{R_H}{R_L}} = 0.316 \frac{f_{notch}}{f_o}$$

00565434

Determine R_F according to the desired gains: $H_o(BR) \Big|_{f < f_{notch}} = \frac{R_F}{R_L} H_o(LP), H_o(BR) \Big|_{f > f_{notch}} = \frac{R_F}{R_H} H_o(HP)$

- Where to use amplifier C:** Examine the above gain relations and determine the dynamics of the filter. Do not allow slew rate limiting in any output (V_{HP} , V_{BP} , V_{LP}), that is:

$$V_{IN(peak)} < 63.66 \times 10^3 \times \frac{I_{SET}}{10 \mu A} \times \frac{1}{f_o \times H_o} \text{ (Volts)}$$

If necessary, use amplifier C, biased at higher I_{SET} , where you get the largest output swing.

Deviation from Theoretical Predictions: Due to the finite GBW products of the op amps the f_o , Q_o will be slightly different from the theoretical predictions.

$$f_{real} \approx \frac{f_o}{1 + \frac{2f_o}{GBW}}, Q_{real} \approx \frac{Q_o}{1 - \frac{3.2f_o \times Q_o}{GBW}}$$

00565435

Active Filters Applications (Continued)

A Simple-to-Design BP, LP Filter Building Block

00565414

• If resistive biasing is used to set the LM346 performance, the Q_o of this filter building block is nearly insensitive to the op amp's GBW product temperature drift; it has also better noise performance than the state variable filter.

Circuit Synthesis Equations

$$H_o(BP) = Q_o H_o(LP); R \times C = \frac{0.159}{f_o}; R_Q = Q_o \times R; R_{IN} = \frac{R_Q}{H_o(BP)} = \frac{R}{H_o(LP)}$$

00565436

•For the eventual use of amplifier C, see comments on the previous page.

A 3-Amplifier Notch Filter (or Elliptic Filter Building Block)

00565415

Circuit Synthesis Equations

$$R \times C = \frac{0.159}{f_o}; R_o = Q_o \times R; R_{IN} = \frac{0.159 \times f_o}{C' \times f_{notch}^2}$$

$$H_o(BR)|_{f < f_{notch}} = \frac{R}{R_{IN}} H_o(BR)|_{f > f_{notch}} = \frac{C'}{C}$$

00565437

•For nothing but a notch output: $R_{IN}=R$, $C'=C$.

Active Filters Applications (Continued)

Capacitorless Active Filters (Basic Circuit)

00565416

- This is a BP, LP, BR filter. The filter characteristics are created by using the tunable frequency response of the LM346.
- **Limitations:** $Q_o < 10$, $f_o \times Q_o < 1.5$ MHz, output voltage should not exceed $V_{peak(out)} \leq \frac{63.66 \times 10^3}{f_o} \times \frac{I_{SET}(\mu A)}{10 \mu A}$ (V)
- Design equations: $a = \frac{R6 + R5}{R6}$, $b = \frac{R2}{R1 + R2}$, $c = \frac{R3}{R3 + R4}$, $d = \frac{R7}{R8 + R7}$, $e = \frac{R10}{R9 + R10}$, $f_o(BP) = f_u \sqrt{\frac{b}{a}}$, $H_o(BP) = a \times c$, $H_o(LP) = \frac{c}{b}$, $Q_o = \sqrt{a \times b}$
 $f_o(BR) = f_o(BP) \left(1 - \frac{c}{b}\right) \cong f_o(BP) (C < 1)$ provided that $d = H_o(BP) \times e$, $H_o(BR) = \frac{R10}{R9}$.
- Advantage: $f_o Q_o$, H_o can be independently adjusted; that is, the filter is extremely easy to tune.
- Tuning procedure (ex. BP tuning)

00565438

1. Pick up a convenient value for b ; ($b < 1$)
2. Adjust Q_o through R5
3. Adjust $H_{o(BP)}$ through R4
4. Adjust f_o through R_{SET}. This adjusts the unity gain frequency (f_u) of the op amp.

Active Filters Applications (Continued)

A 4th Order Butterworth Low Pass Capacitorless Filter

00565417

Ex: $f_c = 20 \text{ kHz}$, H_o (gain of the filter) = 1, $Q_{o1} = 0.541$, $Q_{o2} = 1.306$.

• Since for this filter the GBW product of all 4 amplifiers has been designed to be the same (~1 MHz) only one current source can be used to bias the circuit. Fine tuning can be further accomplished through R_b .

Miscellaneous Applications

A Unity Gain Follower with Bias Current Reduction

00565418

• For better performance, use a matched NPN pair.

Miscellaneous Applications (Continued)

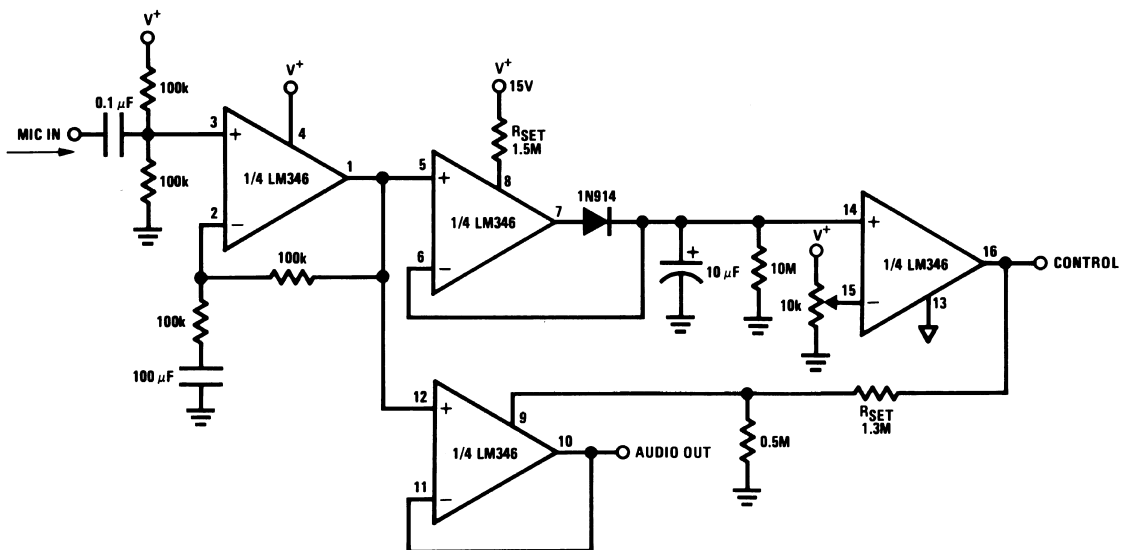

Circuit Shutdown

00565442

- By pulling the SET pin(s) to V^- the op amp(s) shuts down and its output goes to a high impedance state. According to this property, the LM346 can be used as a very low speed analog switch.

Voice Activated Switch and Amplifier

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
